Reflection
11/29/2025

This is my final reflection for the project for the class. Honestly, I am thankful for choosing a tech stack that I had no experience with and it was a huge learning lesson. I was coming into it with a big mindset thinking, "I will get it done." and "It will be easy!" But I was completely mistaken. There were a lot of ups and downs when it came to development and we had a hard time coming together as a team. However, in the end we were able to come up with a solution that allowed us to complete the project.

For starters we used the tech stack Kotlin and SQLite. My team and I had little to no experience on this Tech stack at all. but with our minds connected together we focused on pushing through and understanding that with this project we must learn as software engineers. So to overcome this challenge we read technical documentation written by the kotlin team and we had to read the documentation for SQLite and while doing this we found out there was an actual database we're using called SQLDelight.

After that we were able to come together and design screens the application would like. We had Mustafa help design the screens on figma and it made development a lot easier as we had something to build around. After that we focused a proper procedure on github with developing the Agile way where we took the feature approach for each page. This made it super easy to develop the individual pages and combine our project together in the end.

After that we focused on refactored the code to connect with the database, and made our screens be stateless for the ones that didn't require information to be stored. This allowed us to get much farther as we had to connect our database. The problem was we weren't able to get Sqldelight to connect so we had to bootstrap and go directly back to SQLite and it was only working for the android version. That's okay as we are still working on the project to make sure it works well with the designed application for Kotlin.

Overall, the project was really fun to build and I had a great time building with the rest of my teammates. I learned a lot in development and being able to push myself to get more things done. I was being very proactive and practicing things I learned at work in class while developing this project and it made it a lot easier to develop. I will make sure to take this approach when developing for my other classes as I want to continue to keep making projects that will make me a better software engineer.
