

For the final part of the application, I mainly wrote code for the UI for the Offer a Ride, Ride History (Upcoming), Ride History (Completed), and User Profile pages. I was developing the application on a macOS, so therefore writing code to run it on the iOS simulator. Since we chose Kotlin, I was able to write code for the iOS application and be able to reuse everything to run it on the Android Emulator.

I also worked on preparing the slide presentation in assistance with my teammates. Samii, primarily lead the database connection part of the application and was able to assist me with connection to the database to display all of our mock data. Kennan ensured that we maintain all practices on GitHub for version control and branch history tracking to have a very formal and tracked progress history.

Teamwork - We collaborated closely throughout the process, sharing updates, checking and reviewing each other's code.

Attestation -

Samii Shabuse - I, Samii Shabuse, have read this report and attest that the contents are true and correct.

Kennan Lu - I, Kennan Lu, have read this report and attest that the contents are true and correct.
